1.0 - Unity Project Support

The Drunk Color Pulse post-processing effect works only with Unity Built-in Render Pipeline projects. The effect will not work with Universal Render Pipeline (URP) or High-Definition Render Pipeline (HDRP) projects as these use a different post-processing stack.

2.0 - Project Dependencies

Requires the Unity Built-in Render Pipeline Post-Processing Stack (v2).

Can be installed from: *Windows* → *Package Manager* → *Unity Registry* → *Post Processing*

The post-processing stack can be enabled in your scene by clicking on "Add Component" in the inspector window with your main camera selected and adding a *Post-process Layer* and *Post-process Volume*. Click "New" next to the *Profile* parameter of the *Post-process Volume* to make a new profile and set the *Post-process Layer* component's *Layer* parameter to "Everything".

3.0 - Enabling the Drunk Color Pulse Effect

Click "Add effect..." on your *Post-process Volume* and select:

SynapticResponse → *DrunkColorPulse*.

4.0 - Effect Configuration

The Drunk Color Pulse Effect parameters, displayed under the effect in the *Post-process Volume*, can be overridden and modified as desired.

4.1 - Disabling the Drunk Blur

Override the *Trail Blur Strength* effect parameter and set its value to 0.

4.2 - Changing the Overlay Color

Override the *Overlay Color* effect parameter and set it to your desired color from the color picker dialog.

4.3 - Disabling the Overlay Color

Override the *Overlay Max Intensity* effect parameter and set its value to 0.

4.4 - Disabling Color Pulsation

Override the *Pulse Enabled* effect parameter and set its value to false by unchecking it.

5.0 - Example Scene

An example scene utilizing the Drunk Color Pulse effect is provided in the following location:

/DrunkColorPulse/Demo/DrunkColorPulse.unity
